We're all here

Our next meeting with our TA will be online. Most of us prefer it. November 23.

Nick: Added reorder button which goes into a mode where you can press buttons to change order of stuff. Added an order field in the database which it sorts by. Reordering swaps the order number. Nick had an issue where putting stuff in androidTest works but not in test and he wasted hours on it, so it's not worth fixing, even if it's confusing.

Paola made some code changes. The habit title is no longer the ID. It's now the autogenerated key, and there's now a name field. She changed lots of John's code in order to do this. She added a public/private thing and now there's switches to make stuff public or private when sharing habits. John and Paola have some conflicting changes in habit events so they'll figure it out. John assumed habit IDs would be available in memory, but that caused issues with asynchronous code so Paola changed the editing/adding habit event process.

Jie showed the image selector with camera and gallery. Looks ugly but it works. It'll have to be integrated into John's new stuff and it should be easy.

John shows changes to displaying habits. Add/edit habit events is changed. There should still be some UI changes, like moving the back button into a place that makes more sense. Both John and Nick are having issues testing the database using Mock or something.

Zarif implemented intent testing for the habit sharing stuff. Did UI mockups. Zarif will replace toasts with infotags for errors in finding users.

Aparna did the map stuff.

Our next deadline is by next Friday, so we have the weekend to do stuff.

We're meeting Saturday 10 AM, so that's our due date.

On Tuesday we'll show our TA our UI, UML, CRC. See if we're on the right track. We'll meet online.
